INTERPRETATION:

KFT are simple tests that measure certain substances in your blood and urine. These substances are related to filtration in kidneys, which give an idea of kidney function. These tests mainly detect levels of serum creatinine and blood urea nitrogen, which are done through a blood test. A 24-hour urine sample may be taken to detect creatinine clearance from the body and filtration rate of the kidneys. There are other parameters like protein, albumin, minerals, electrolytes etc., which may also be checked, depending on the type of kidney tests.
